

WELD BRUSH PRO

FOR BYMAT STAINLESS STEEL CLEANERS.

The **Weld Brush Pro** is a revolutionary new design with a retractable outer sleeve. With a simple twist of the handle the outer sleeve can be adjusted to give the operator the desired brush length required.

Previous makes and models of weld cleaning brushes performed more like a mop than a brush due to their floppy bristles. With the **Weld Brush Pro** this problem has been eliminated. The operator can set the desired brush stiffness by extending or retracting the outer sleeve.

Due to the brush wearing evenly from the tip, the life of each brush head is dramatically increased. When the brush head wears, simply turn the handle to expose more of the brush. The adjustments can be made with one hand and without unplugging or removing any parts from the brush handle. Replacing the brush head is performed by retracting the outer sleeve fully to expose the brush ferrule, unscrewing the old brush and replacing with a new one.

The **Weld Brush Pro** bristles are constructed from a carbon fibre super conductor for unbeatable performance. The ergonomic design of the curved easy grip handle, make it comfortable to use.

The **Weld Brush Pro** can be used on all existing Bymat 1024 (cleaning and polishing) and 1124 (cleaning only) machines using the same, environmentally friendly, electrolytic solutions. Simply dip into the solution and wipe across the weld area for fast efficient cleaning.

The **Weld Brush Pro** can also be adapted to fit other makes of machines.

Registered design, manufactured in the UK and available from stock
